EXECUTIVE SUMMARY

Telling residents what is happening, and proving you did, is a duty as much as a courtesy.

The clearest example is in the UK. Since October 2025 social landlords in England have had 24 hours to investigate and make safe emergency hazards in tenants' homes.[1] From 30 November 2026 the same regime extends to further hazards including fire, electrical hazards and excess cold.[2,3] Responsible persons for multi-occupied residential buildings must already give residents fire safety instructions, and from April 2026 taller blocks need evacuation plans for residents who cannot get out unaided.[4,5]

These UK duties follow the Grenfell Tower Inquiry. Its Phase 2 report found that the landlord's information about vulnerable residents was incomplete on the night of the fire, that the fire brigade's control room was not prepared for a flood of calls, and that the council had no effective system for communicating with those affected.[6]

Elsewhere the duties sit mainly in fire and building codes adopted locally: NFPA 101 where US states and cities adopt it, national codes in each EU member state, and civil defence codes in the UAE and Saudi Arabia.[7,8,9,10] A new risk cuts across all of them: in October and November 2026, attackers reached internet-exposed refrigeration controllers across Europe, and the UK's National Cyber Security Centre warned that heating and other building controls could also be at risk.[11,12]

This report sets out the duties, the evidence behind them and the emerging threat, and ends with practical recommendations for landlords, managing agents and facilities leaders wherever they operate.

THE BOTTOM LINE

Treat resident communication as part of the safety system: know who is in each building and who needs help, reach them in minutes on more than one channel, keep building controls off the internet, and keep a timestamped record of every decision.

KEY FINDINGS

Seven things the evidence tells us

01 **Response times are now law for social landlords in England.**

Emergency hazards must be investigated and made safe within 24 hours of the landlord becoming aware of them.[1,2]

02 **The English scope widens from 30 November 2026.**

Phase 2 of Awaab's Law adds fire, electrical, excess cold and heat, falls, structural collapse and domestic hygiene hazards.[2]

03 **In England, residents must be told how to stay safe.**

Fire safety instructions go to all residents every 12 months, and in taller blocks residents who cannot evacuate unaided must be offered a plan.[4,5]

04 **Elsewhere, the duties sit in codes adopted locally.**

NFPA 101 applies where US jurisdictions adopt it; EU building rules stay national; the UAE and Saudi Arabia have civil defence fire codes.[7,8,9,10]

05 **Grenfell's communication failures were systemic.**

Incomplete records of vulnerable residents, an overwhelmed control room and no way to reach displaced people all contributed.[6,13]

06 **Communication is where landlords most often fail residents.**

England's Housing Ombudsman found poor communication and record keeping running through its most serious repairs cases in 2025-26.[14]

07 **Exposed building controls are a live target.**

Attacks on refrigeration controllers in 2026 used internet-exposed interfaces and, in some cases, published default passwords.[11,15]

AT A GLANCE

Building safety and communication, in six figures

Each figure is sourced and labelled where it applies to one country. Legal duties are summarised; the regulations set out the detail.

24 hours

England: to investigate and make safe an emergency hazard in social housing under Awaab's Law.[1]

30 Nov

2026: the date Phase 2 of Awaab's Law applies from in England, after approval by both Houses of Parliament in October.[2,3]

58

Grenfell Phase 2 recommendations. The government accepted all of them, 49 in full and 9 in principle.[16]

24 hours

US: correction timeframe for a missing or non-working smoke alarm under HUD's NSPIRE inspection standard.[17]

62%

Share of England's Housing Ombudsman findings in 2025-26 that were maladministration.[14]

53%

Fall in internet-exposed refrigeration controllers Censys observed between 9 October and 5 November 2026.[18]

TIMELINE

From Grenfell to Awaab's Law

Key dates for residential and building safety communication, mostly in the UK, with EU and Gulf milestones.

14 June 2017 — **Grenfell Tower fire (UK)**
Fire sweeps through the tower in a few hours. A public inquiry follows.[6]

21 June 2022 — **EU public warning deadline**
Member states must ensure official public warnings reach mobile users.[19]

23 January 2023 — **Fire Safety (England) Regulations**
Duties on resident information, fire doors, lifts and information boxes take effect.[4]

4 September 2024 — **Grenfell Phase 2 report**
Fifty-eight recommendations; the UK government later accepted all of them.[13,16]

7 April 2025 — **Dubai Civil Defence law**
Dubai Law No. 4 of 2025 is issued, setting owners' duties on fire systems and safety requirements.[20]

27 October 2025 — **Awaab's Law Phase 1**
24-hour duty for emergency hazards in social housing in England.[1]

8 January 2026 — **EU Construction Products Regulation**
The main part of Regulation (EU) 2024/3110 applies.[8]

6 April 2026 — **Residential evacuation plans**
Evacuation plans for residents who need help, in scope buildings in England.[5]

12 October to 5 November 2026 — **Attacks on refrigeration controllers**
CERT-FR alert, a second European wave, UK alerts and a US fact sheet.[11,15,18,21]

30 November 2026 — **Awaab's Law Phase 2**
England: fire, electrical, excess cold and other hazards brought into the timescales.[2]

PART 01

The duties.

What the law requires landlords and building managers to do, and to tell residents: the new UK regime in detail, then the equivalents in the US, the EU and the Gulf.

01 UK: Awaab's Law and the 24-hour clock

02 UK: the duties at a glance

03 UK: fire safety, evacuation and the regulator

04 Equivalent duties, region by region

UNITED KINGDOM

Awaab's Law and the 24-hour clock

> **The clock starts when the landlord becomes aware, often through an out-of-hours call.**

The Hazards in Social Housing (Prescribed Requirements) (England) Regulations 2025, known as Awaab's Law, came into force on 27 October 2025.[1] They apply to social landlords in England.

An emergency hazard is defined as one that poses an imminent and significant risk of harm to the health or safety of an occupier, which a reasonable landlord would act on to make safe within 24 hours.[1] The landlord must investigate and complete any safety work as soon as reasonably practicable, and within 24 hours of the duty applying.[1] Government guidance puts it plainly: both must be completed within 24 hours of becoming aware of the hazard.[2]

The regulations also govern communication. After an investigation, the landlord must give the tenant a written document setting out its findings within three working days, and keep the tenant informed about the timing and progress of work.[1] Where a home cannot be made safe in time, the landlord must secure suitable alternative accommodation at no cost to the household.[1]

Phase 1 covered emergency hazards and significant damp and mould. Amending regulations, approved by the House of Lords on 14 October and the House of Commons on 20 October 2026, are due to extend the regime from 30 November 2026.[3] Phase 2 adds excess cold and heat, falls, structural collapse, fire and explosions, electrical hazards and domestic hygiene where they present a significant risk of harm.[2]

There is one carve-out that matters for building managers. Guidance states that Awaab's Law does not apply to fire hazards in communal areas already covered by the Regulatory Reform (Fire Safety) Order 2005, such as damaged fire doors or blocked escape routes, which remain for the responsible person.[2,22] Fire hazards inside homes, such as broken smoke alarms, are in scope.[2]

The practical effect is a clock that starts when a landlord becomes aware, often through an out-of-hours call. Meeting it depends on reports reaching the right person quickly and on a reliable record of when each step happened. Landlords outside England face their own clocks, set by local housing codes and funding conditions, and the same discipline applies.

UNITED KINGDOM

The UK duties that shape emergency communication

England only. Summaries; the regulations and guidance contain conditions and exceptions.

LAW	APPLIES TO	WHAT IT REQUIRES ON COMMUNICATION
Awaab's Law	Social landlords[1]	Emergency hazards investigated and made safe within 24 hours; written findings to tenants; progress updates.
Fire Safety (England) Regulations 2022	Responsible persons for multi-occupied residential buildings[4]	Fire safety instructions and fire door information to residents; lift faults over 24 hours reported to the fire service in high-rise blocks.
Residential Evacuation Plans Regulations 2025	Blocks of 18m or seven storeys, or over 11m with simultaneous evacuation[5]	Identify residents who need help, offer assessment and plans, share basic details with the fire service with consent.
Building Safety Act 2022, s91	Principal accountable persons for occupied higher-risk buildings[23]	A residents' engagement strategy covering information, consultation and how views are taken into account.
Building Safety Act 2022, s87	Accountable persons for occupied higher-risk buildings[24]	Prescribed safety occurrences reported to the Building Safety Regulator.

UNITED KINGDOM

Fire safety, evacuation and the regulator

> **Basic details go to the fire service only with the resident's explicit consent.**

The Fire Safety (England) Regulations 2022 came into force on 23 January 2023.[4] In any building with two or more homes and common parts used for evacuation, the responsible person must display fire safety instructions covering the evacuation strategy and how to report a fire, give them to new residents promptly and to all residents every 12 months, and tell residents about fire doors.[4]

Buildings of at least 18 metres or seven storeys carry more. They need a secure information box, floor and building plans for the fire service, wayfinding signs that can be read in low light, and monthly checks of firefighting and evacuation lifts. A lift fault that cannot be fixed within 24 hours must be reported to the fire and rescue service, and so must the fix.[4]

From 6 April 2026, the Fire Safety (Residential Evacuation Plans) (England) Regulations 2025 apply to blocks of at least 18 metres or seven storeys, and to those over 11 metres with a simultaneous evacuation strategy.[5] The responsible person must use reasonable endeavours to identify residents who cannot evacuate unaided, offer a person-centred fire risk assessment, agree an emergency evacuation statement, and prepare a building emergency evacuation plan for the fire service. Basic details go to the fire service only with the resident's explicit consent.[5]

For higher-risk buildings, the Building Safety Act 2022 adds a residents' engagement strategy, setting out what information residents will receive about building safety decisions and what they will be consulted on, and a duty to report prescribed safety occurrences to the regulator.[23,24]

The Building Safety Regulator became a standalone body sponsored by MHCLG on 27 January 2026, a step towards the single construction regulator the Grenfell Tower Inquiry recommended.[25] The government's response to the inquiry also notes that statutory guidance now requires evacuation alert systems in new blocks of flats over 18 metres.[16]

REGIONAL NOTES

Equivalent duties, region by region

Outside the UK there is rarely one housing-specific regime. The duties sit in fire and building codes, workplace rules and housing standards, often adopted city by city.

REGIONAL NOTE · UNITED KINGDOM

England: Awaab's Law clocks for social landlords; fire safety instructions to residents every 12 months; evacuation plans for residents who need help in taller blocks; a residents' engagement strategy and occurrence reporting for higher-risk buildings.[1,4,5,23]

IN PRACTICE Scotland, Wales and Northern Ireland have their own fire and housing rules; check each.

REGIONAL NOTE · UNITED STATES

NFPA 101, the Life Safety Code, is a model code for new and existing buildings that applies where a state or local jurisdiction adopts it.[7] Employers need an emergency action plan where an OSHA standard requires one, with procedures to account for employees after evacuation.[26] In HUD-assisted housing, a missing smoke alarm must be corrected within 24 hours.[17]

IN PRACTICE NFPA 1660 (2024) is a voluntary standard for emergency, continuity and crisis management.[27]

REGIONAL NOTE · EUROPEAN UNION

Building and fire safety requirements stay with member states; Regulation (EU) 2024/3110 harmonises how construction products are assessed, applying mainly from 8 January 2026.[8] Employers must arrange first aid, fire-fighting and evacuation of workers.[28] Official public warnings must reach mobile users.[19]

IN PRACTICE Map the national code, the fire authority and the warning system for each country in your portfolio.

REGIONAL NOTE · MIDDLE EAST (UAE, SAUDI ARABIA)

UAE: the UAE Fire and Life Safety Code of Practice, from Civil Defence, is the national fire code.[9] In Dubai, owners must maintain fire systems, follow Civil Defence safety requirements and name a person who keeps occupants informed.[20] **Saudi Arabia:** SBC 801 covers emergency plans, drills and mass notification.[10]

IN PRACTICE In the UAE, NCEMA 7000 is the national business continuity standard; check whether your sector applies it.[29]

A summary for orientation, not legal advice. Requirements depend on sector, size, licence and jurisdiction, and change over time. Confirm the current text with your legal and compliance teams.

PART 02

The lessons.

What the UK's Grenfell Tower Inquiry and England's Housing Ombudsman say about communication when it matters most. The lessons apply wherever people live in shared buildings.

01 What Grenfell revealed

02 Four failures of information

03 The everyday test

UNITED KINGDOM

What the Grenfell Tower Inquiry found about communication

> **None of these failures needed new technology to avoid. They needed current records and rehearsed plans.**

The UK inquiry's Phase 2 report, published on 4 September 2024, set out how a concrete tower became a death trap through the failings of many institutions over many years.[6]

Before the fire, the landlord's emergency plan for the tower was out of date and incomplete, and the absence of fire action notices was a prominent subject of complaints by residents.[6] Its data systems on vulnerable residents were not co-ordinated, and the spreadsheet available on the night was incomplete: a basic neglect of its fire safety obligations, the inquiry said.[6]

During the fire, the London Fire Brigade had not prepared for a large number of calls from people needing rescue. Staff were forced to improvise ways of handling the information, and it had not produced contingency plans for a full evacuation.[6]

After the fire, the response of government and the council in the first week was described as muddled, slow, indecisive and piecemeal.[6] The council had no arrangements for identifying people forced from their homes or for communicating with them, and arrangements for obtaining and sharing reliable information were lacking.[6]

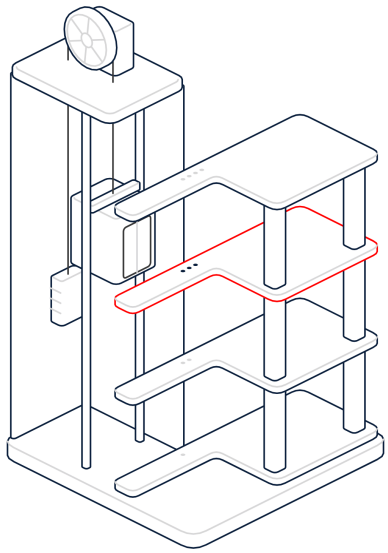

The inquiry's recommendations follow from this. Local authorities should practise recording information about displaced people and communicate continuously with those who need help, in suitable languages. Responsible persons should collect enough information about vulnerable occupants to assist their escape.[13]

None of these failures needed new technology to avoid. They needed current records, rehearsed plans and someone accountable for telling people what was happening.

FOUR FAILURES

Four failures of information the inquiry identified

Each has a direct counterpart in today's UK duties, and in good practice anywhere.

01 Records of who needs help

Incomplete information on vulnerable residents on the night. Now addressed by residential evacuation plans in scope buildings.[5,6]

02 Instructions residents can follow

An out-of-date emergency plan and missing fire action notices. Now addressed by annual fire safety instructions.[4,6]

03 Handling a surge of calls

No preparation for many simultaneous calls for rescue, and improvised information handling.[6]

04 Reaching people afterwards

No system to identify or communicate with displaced residents, and no reliable records.[6,13]

UNITED KINGDOM

The everyday test: what the Ombudsman sees

> **A resident who has waited weeks for a reply about a leak will not trust an instruction to stay put at 2am.**

Emergencies test communication that is already in place. The Housing Ombudsman for England's Annual Complaints Review for 2025-26 shows how often that everyday communication falls short. Of its findings, 62% were maladministration and a further 2% severe maladministration.[14]

Responsive repairs featured in 80% of cases and accounted for most severe findings. Across those severe cases, the Ombudsman identified poor communication and inadequate record keeping as recurring failures.[14] Damp, mould and leaks made up a large share of repairs complaints, the same territory Awaab's Law now governs.[14]

The Ombudsman reports that Awaab's Law cases are beginning to reach it, and that early insights suggest landlords are struggling to identify them and respond within the timescales.[14]

Records matter as much as messages. A landlord that cannot show when it was told about a problem, what it did and what it told the resident will find the same gap exposed when an emergency hazard and its 24-hour clock are disputed.

The lesson for landlords in any country is uncomfortable but useful. A resident who has waited weeks for a reply about a leak will not trust an instruction to stay put at 2am. Trust built in ordinary times is what makes emergency messages work.

PART 03

The new threat.

Building controls connected to the internet, and what the 2026 attacks mean for landlords and facilities teams.

01 When building controls are attacked

02 What good control looks like

03 What it means for the industry

BUILDING CONTROLS

When building controls are attacked

> **Exposed controllers were reached with weaknesses that had been known for a long time.**

On 12 October 2026 France's national CERT issued an alert after numerous compromises of remote controllers for refrigeration installations, naming Danfoss AK-SM and AK-SC, Copeland XWEB and Dixell XWEB products.[11] It said attack campaigns were probably still under way and that exposing these management interfaces to the internet was contrary to good practice.[11]

Censys reported that the night of 11 October attacks switched units at hundreds of French supermarkets into defrost. Overnight on 2 November, grocers in Belgium, Estonia, Ireland, Luxembourg, the Netherlands and Sweden reported similar attacks.[18] In the UK, three members of the Association of Independent Meat Suppliers and a fruit and vegetable wholesaler were affected; no stock was reported lost.[15]

The NCSC's director of operations said the attacks used vulnerabilities that had been out there for a long time and were not sophisticated. Its chief executive called them the foothills of a wider threat.[15] In remarks reported by PA Media, he named heating and refrigeration controls among systems often under-secured.[12]

US agencies described the risk in terms any building manager will recognise. Attackers could change temperatures, creating fire hazards and equipment damage, and cause a loss of visibility of current conditions. Their advice: remove internet exposure, separate operational technology from business networks, change default passwords, patch or replace end-of-life devices, log activity and set safe limits with alerts.[21]

No compromise of a UK building management system was confirmed in this wave, and we found no public evidence that residential buildings were targeted. But the controllers that run heating, ventilation, lifts, pumps and smoke control are often managed remotely by contractors in the same way. CERT-FR warns that resetting an end-of-life device that stays exposed leaves it open to reinfection.[11] The NCSC publishes guidance on secure connectivity for operational technology.[30]

BUILDING CONTROLS

What most organisations get wrong

Building controls are usually owned by facilities, maintained by contractors and invisible to IT. That gap is where the risk sits.

AREA	WHAT OFTEN HAPPENS	WHAT GOOD LOOKS LIKE
Inventory	Nobody holds a list of BMS, lift, plant and refrigeration controllers.	A list of every controller, its location, owner, contractor and how it is reached.
Remote access	A web page left open so a contractor can log in from anywhere.	Access only through a secured connection, with internet exposure removed.[11,21]
Passwords	Factory defaults, sometimes printed in public manuals.	Defaults changed, accounts named, stronger authentication where feasible.[15,21]
Lifecycle	Controllers run for years past vendor support.	End-of-life devices identified, isolated and replaced.[21]
Monitoring	Changes noticed only when residents complain.	Safe setpoint limits with alerts, and logs reviewed.[21]
In an incident	A contractor resets the device remotely.	Settings recorded first, access cut, residents told what to expect.

WHAT IT MEANS

What it means for organisations in Property, Housing and Facilities

> **Whatever the local rules, the clock usually starts with an out-of-hours call.**

First, response clocks are getting shorter and more explicit. Whatever the local rules, the clock usually starts when the organisation becomes aware, often through an out-of-hours call. Reporting routes, contractor response and a timed record of awareness are what get tested.

United Kingdom: for social landlords in England, more hazards fall within Awaab's Law from 30 November 2026, including electrical faults and excess cold.[2] Annual fire safety instructions and, in taller buildings, lift fault reporting and evacuation plans are already required.[4,5] For higher-risk buildings, a standalone regulator is likely to ask for evidence.[23,24,25]

United States, EU and Gulf: know which code edition each city or country has adopted, and who must be told what. In Dubai, a named person must keep occupants informed; in the US, workplaces need emergency action plans; in the EU, national codes govern and official public warnings now reach phones.[19,20,26]

Second, building controls are now part of the emergency picture. The 2026 attacks are a prompt to find every controller that can be reached from the internet. Loss of heating, ventilation or access is an operational emergency, and in residential settings a welfare one.[12,21]

Third, the Grenfell findings point to capabilities that matter in every country: current records of who is in the building and who needs help, rehearsed ways of reaching people quickly, and reliable records of what was done.[6,13]

RECOMMENDATIONS

Seven steps for landlords and building managers

01 Map the clock

Trace how an out-of-hours hazard report reaches a decision-maker, and how awareness is timed, against the local rules for each building.

02 Know who needs help

Current, consented records of residents who may need help to evacuate.[5,13]

03 Take building controls off the internet

Inventory BMS and plant controllers, remove exposure and change default passwords.[11,21]

04 Approve messages in advance

Templates for each emergency, consistent with the fire safety instructions residents already hold.

05 Reach people on more than one channel

Use suitable technology and languages, and track who has not acknowledged.[13]

06 Log every decision

Timestamp each alert, decision and acknowledgement.

07 Exercise at night

Rehearse a night incident with a strategy change, at least annually.

FOR THE BOARD

Questions boards should ask

Answers should be specific, dated and owned.

DUTIES

- ? Do we know which fire, building and housing rules apply to each of our buildings, in each country and city?
- ? Are we meeting every response clock that applies to us, including Awaab's Law in England, and how do we know?
- ? Which residents need help to evacuate, and when did every resident last receive fire safety instructions?

READINESS

- ? How long would it take to reach every resident of our largest building at 3am, and how would we know who we had missed?
- ? Which of our building controllers can be reached from the internet, and who can change them?
- ? Could we produce a timed record of every decision from our last serious incident?

GLOSSARY

Terms used in this report

Awaab's Law
UK: the common name for the Hazards in Social Housing (Prescribed Requirements) (England) Regulations 2025.

Emergency hazard
UK: a hazard posing an imminent and significant risk of harm that a reasonable landlord would make safe within 24 hours.

Responsible person
UK: the person with duties under the Fire Safety Order for the common parts of a building.

Higher-risk building
UK: in occupation, a building at least 18 metres or seven storeys tall with at least two residential units.

Accountable person
UK: a person who holds a legal estate in, or has a repairing obligation for, the common parts of a higher-risk building.

Residential PEEP
UK: a personal emergency evacuation plan for a resident who cannot evacuate unaided.

Life Safety Code
US: NFPA 101, a model code that applies where a state or local jurisdiction adopts it.

Simultaneous evacuation
A strategy in which everyone leaves at once, used where stay put is not appropriate.

Safety occurrence
UK: an incident or situation relating to fire spread or structural integrity that must be reported to the regulator.

BMS
Building management system: controls for heating, ventilation, lighting, pumps and sometimes lifts and access.

Operational technology
Systems that monitor and control physical equipment, as opposed to business IT.

WHY COORDINATION, NOT JUST NOTIFICATION

Most organisations can send alerts. Few can manage incidents end-to-end.

When a fire alarm sounds in a high-rise at 02:10, a text to residents is minute one. Keeping everyone safe depends on which residents need help, which contractor is on the way, who changed the evacuation strategy, and a record you can stand behind later.

WHERE INCIDENTS GO WRONG

01	**Fragmented information**	Different teams work from different information.
02	**Delayed decision making**	Leadership lacks visibility, so decisions wait.
03	**Uncoordinated response**	Several teams work independently on the same problem.
04	**Lack of visibility**	Critical actions become difficult to track.
05	**Lack of accountability**	Actions and decisions are poorly documented.

THE WHOLE INCIDENT, IN ONE PLATFORM

Crises Control is an **Operational Incident Coordination Platform**. It helps organisations maintain operational control during incidents by combining alerting, coordination, execution, visibility and accountability in one platform.

WHAT IS STANDARD, WHAT IS CONFIGURED

Clear about what the platform does.

Some capabilities work as standard. Others depend on how your team sets up plans, groups and rules, or on connecting your own systems. Your demonstration and implementation plan confirm what applies to you.

STANDARD	CONFIGURED	INTEGRATIONS
Included in how each module works.	Set up by your team to match your plans.	Connected to your other systems, where configured.
SOS press-and-hold alert from the mobile app, raising an incident and sharing location where available	Response plans, task lists and message templates per incident type	Directory sync with Microsoft Entra ID, SCIM or scheduled file import
Ping alerts by push, SMS, voice, email and desktop, with one-tap acknowledgement	Groups, sites and audiences to target	Single sign-on with Entra ID, Google Workspace or Okta
Incident Manager workspace, roles and a single communication log	Escalation rules and timings when people do not respond	The Microsoft Teams app, enabled by your administrator
Task Manager tasks with owners and deadlines when a plan is activated	Cascading from one channel to the next	Triggers from monitoring or other systems, set up as an integration project
Control Centre live view of status, acknowledgements, tasks and locations	Response options people can choose when they acknowledge	
Audit & Reporting: timestamped records, exportable as PDF or CSV		
CRAiG (beta): answers questions and summarises your incident data within each user's permissions		

> Crises Control does not detect incidents on its own. Incidents are raised by people, through SOS, the app or the web, or by connected systems where an integration has been configured. From that point the platform coordinates the response.

USE CASES

How organisations use Crises Control in property, housing and facilities

From the first alert to the final record: the incidents this platform is used for, and how the modules work together in each.

Resident emergency communication

INTENDED USE

TRIGGER Fire, evacuation, flooding, gas incident or another building emergency

Notify residents and building teams, provide instructions and updates, and use responses to identify who has acknowledged or needs follow-up.

Ping | Incident Manager | two-way response | Control Centre

Multi-building incident management

SUGGESTED APPLICATION

TRIGGER An incident affects several buildings or properties in a managed portfolio

Target communications to affected properties, coordinate local building teams and contractors, and maintain a consolidated view of response activity.

Ping | Incident Manager | Task Manager | Control Centre | Audit & Reporting

Resident welfare and assistance checks

SUGGESTED APPLICATION

TRIGGER An incident affects residents who may need additional help or have not responded

Collect resident status responses, identify outstanding acknowledgements and direct follow-up to the appropriate building or welfare team.

Ping | Incident Manager | Control Centre | Task Manager

Out-of-hours incident response

SUGGESTED APPLICATION

TRIGGER An overnight or weekend emergency requires on-call managers or contractors

Alert the on-call response group, track acknowledgement, escalate non-response and coordinate actions until the incident is resolved.

Ping | Incident Manager | Task Manager | Control Centre

Contractor and facilities coordination

SUGGESTED APPLICATION

TRIGGER Lift failure, water leak, power outage, heating failure or urgent repair

Notify facilities teams and contractors, assign inspection and repair tasks, set owners and deadlines, and monitor completion.

Ping | Incident Manager | Task Manager | Control Centre | Audit & Reporting

Customer examples are based on how customers use Crises Control today; customer names have been removed. Customer requirements describe needs raised by customers or in evaluations. Intended, suggested and illustrative use cases show how the platform can be applied and are not presented as existing customer deployments. Capabilities marked 'where configured' or 'where available' depend on each organisation's set-up.

READINESS ASSESSMENT

How ready is your response?

Score each area from 0 (not in place) to 3 (fully in place) for your property and housing organisation, then add up the total.

AREA	THE QUESTION	SCORE 0 TO 3
01 · ACTIVATION **Alert**	Can you reach the right people on more than one channel within minutes, day or night? GOOD LOOKS LIKE Residents, staff and contractors reached on several channels, including people without smartphones.	0 1 2 3
02 · ACTIVATION **Acknowledge**	Do you know who has seen the alert, and does silence trigger escalation by rule? GOOD LOOKS LIKE Acknowledgement tracked by block and by flat; vulnerable residents followed up first.	0 1 2 3
03 · COORDINATION **Escalate**	Are escalation paths set by role and time, not by whoever remembers who to call? GOOD LOOKS LIKE Out-of-hours escalation to the duty manager and contractor follows rules set in advance.	0 1 2 3
04 · COORDINATION **Coordinate**	Is there one shared workspace and log for the incident, not scattered calls, chats and inboxes? GOOD LOOKS LIKE One log for the incident, shared by housing, repairs, the fire service liaison and communications.	0 1 2 3
05 · EXECUTION **Execute**	Are your procedures turned into owned tasks with deadlines that someone can track? GOOD LOOKS LIKE Repair, damp and fire safety actions run as tasks with owners and deadlines.	0 1 2 3
06 · EXECUTION **See**	Can leaders see tasks, people, locations and blockers live, without having to ask? GOOD LOOKS LIKE A live view of buildings, residents contacted and jobs outstanding.	0 1 2 3
07 · ASSURANCE **Prove**	Could you produce a timestamped timeline for a regulator, insurer or inquiry within a day? GOOD LOOKS LIKE A defensible, timestamped record of every decision and message.	0 1 2 3
08 · ASSURANCE **Rehearse**	Do you exercise the whole response, not just the call tree, at least once a year? GOOD LOOKS LIKE Night-time scenarios rehearsed, including a change from stay put to evacuation.	0 1 2 3

0 to 8
Alerting only
You can send messages. The response still depends on people and luck.

9 to 16
Coordinating in parts
Some steps work. Gaps appear at night, at scale or when systems fail.

17 to 24
Coordinated and provable
You can run the response and show exactly what happened.

BUYER'S GUIDE

Eight questions to ask any incident platform supplier

Many tools can send an alert. These questions separate a notification tool from a platform that coordinates the whole response.

01 **Does it stop at the message?**
Ask what the platform does after the alert is sent: tasks, log, escalation, recovery.

02 **Can it prove who acknowledged?**
Delivery is not acknowledgement. Ask how silence is spotted and escalated, and what you must configure.

03 **Does it run your procedures?**
Ask whether your plans become owned tasks with deadlines, or stay as documents.

04 **Is there one shared picture?**
Ask what leaders see live, and whether it needs someone to update a spreadsheet.

05 **Does it work when your systems do not?**
Ask how teams coordinate if email, chat or your network is down.

06 **Can frontline staff raise the alarm?**
Ask how a colleague on site escalates, with their location where available, in one action.

07 **What evidence does it leave behind?**
Ask for a sample timeline of the kind a regulator, insurer or inquiry would want.

08 **Can you rehearse in it?**
Ask whether you can run exercises on the same platform you would use for real.

BOOK YOUR PROPERTY, HOUSING AND FACILITIES PLATFORM DEMONSTRATION

Watch a night-time fire run end to end.

Most organisations can send alerts. Few can manage incidents end-to-end. In a live, 30-minute demonstration built around a property, housing and facilities incident, you will see how our incident management software, an Operational Incident Coordination Platform, takes one incident from first alert to final report. Bring your own scenario.

WHAT YOU WILL SEE

01	SOS	A concierge raises a fire alarm alert from the building, with location where available.
02	PING	Residents, the duty manager and contractors are alerted; acknowledgements come back by flat.
03	INCIDENT MANAGER	The incident is activated, roles assigned and the evacuation decision logged.
04	TASK MANAGER	Welfare checks for residents with assistance needs become owned tasks.
05	CONTROL CENTRE	The duty manager sees buildings, residents reached and jobs outstanding.
06	AUDIT & REPORTING	A defensible record of every message and decision is produced.
07	CRAIG	CRAiG helps the duty manager find information in the platform and summarise the incident so far.
