TRANSPUTEC

THE COST CONTROL SERIES

November 2026 Playbooks.

Five practical playbooks across AWS, FinOps and IT Procurement. One cost-control story, building to the February webinar.

INSIDE

Five weeks, five playbooks.

Read end to end, or go straight to the week you are posting.

01

WEEK 1 · AWS

03

Decision or delivery

A practical guide to buying the right kind of AWS help. Read it end to end, or jump to the worksheet before your next supplier conversation.

02

WEEK 2 · FINOPS

15

Where cloud cost hides

Five places AWS spend hides, what each looks like, where to look in your own account and what to do first.

03

WEEK 3 · AWS · FINOPS

27

FinOps, explained

What FinOps really means, the four parts that make it work, who does what, and how to start in your first month.

04

WEEK 4 · IT PROCUREMENT

40

The real cost of a device fleet

Why the purchase price is the smallest part of owning a device, and how to plan the whole lifecycle from day one.

05

WEEK 5 · FINOPS

53

Your AWS cost-control checklist

Five checks to review your own AWS cost each month, with the tools to use, how to tell it is working and a printable checklist.

WEEK 1 · AWS

Decision or delivery?

AWS consultancy and AWS managed services sound alike. They are two different purchases. This playbook helps you buy the one you actually need.

INSIDE

Contents

A practical guide to buying the right kind of AWS help. Read it end to end, or jump to the worksheet before your next supplier conversation.

Introduction 05

01 Know the difference 06

02 Avoid the expensive mistakes 10

INTRODUCTION

Two purchases that sound the same.

Most AWS conversations start with a vague request for help. The first job is to decide which kind of help you are buying, because the contract, the team and the measure of success are all different.

Consultancy buys a decision

Advice, design and a defined piece of work that ends with a clear recommendation or a finished change.

A managed service buys delivery

A team that runs the estate every day: monitoring, patching, backups, support and cost reporting against agreed service levels.

Mixing them up is expensive

Buy advice when you needed operations and nothing gets run. Buy operations when you needed a decision and you pay to run the wrong thing well.

01

PART 01

Know the difference.

Side by side, the two look nothing alike once you ask what you get at the end.

01 Consultancy vs managed service

02 When you need a consultancy

03 When you need a managed service

SIDE BY SIDE

What you are actually buying

Use this table to test any proposal. If the answers on the page do not match the column you meant to buy, stop and ask why.

	CONSULTANCY	MANAGED SERVICE
The outcome	A decision, a design or a completed project.	An estate that is run, watched and improved every day.
Duration	Fixed. It has a start, an end and a handover.	Ongoing. It renews and evolves with the business.
How it is priced	By project, phase or day rate.	By a recurring service fee, usually tied to scope.
Success looks like	A clear recommendation you can act on.	Service levels met, incidents handled, costs kept in check.
Who owns the outcome	You own the decision. They own the quality of the advice.	They own day to day operations. You own the priorities.
Typical deliverables	Assessments, architecture, migration plans, a cost or security review.	Monitoring, patching, backup, support desk, monthly reporting.
When it ends	When the work is delivered and handed over.	When you choose to exit, using the exit plan agreed up front.

SIGNALS

When you need a consultancy

You need a decision, a design or a one-off change, and you have, or will have, people to run what comes after.

You are planning a move

A migration, a re-platform or a new region, and you need a plan the board can sign off.

Something needs a second opinion

A cost, security or resilience review before you commit more budget.

The architecture has drifted

The estate grew project by project and nobody can explain the whole design any more.

A decision is waiting on evidence

Leaders want options, risks and a recommendation, not a running service.

Ask: at the end of this work, what decision will we be able to make that we cannot make today?

SIGNALS

When you need a managed service

You know what the estate should look like. What is missing is the capacity to run it well, every day.

Alerts go unanswered

Monitoring exists, but nobody is clearly responsible for acting on it out of hours.

Patching and backups slip

Routine work loses to project work, and the gaps only show during an incident.

Your team is firefighting

Skilled engineers spend their week on tickets instead of the roadmap.

Cost needs watching, not fixing once

Spend creeps back after every clean-up because nobody reviews it each month.

> Ask: who will run this at two in the morning, and how will we know it was handled?

02

PART 02

Avoid the costly mistakes.

Most problems come from buying one kind of help and expecting the other.

01 Five common mistakes

02 Questions to ask before you buy

03 Decision worksheet

COMMON MISTAKES

Five ways the purchase goes wrong

Each of these is common, and each is avoidable with one clear conversation before the contract is signed.

01 **Expecting a consultancy to run things**

The report lands, the team leaves and nobody is responsible for the changes it recommended.

02 **Expecting a managed service to set strategy**

The estate runs smoothly in the wrong direction because nobody owns the design decisions.

03 **Scoping by hours, not outcomes**

Time gets used, but the decision or the service level you needed is never defined.

04 **No handover or exit plan**

Knowledge leaves with the supplier, or switching later becomes painful and slow.

05 **Nobody owns the cost**

Advice and operations both assume the other side is watching the bill.

REMEMBER

Many organisations need both, in sequence: a consultancy to decide what good looks like, then a managed service to keep it that way.

BEFORE YOU BUY

Questions to take into the room

Ask these of any AWS partner. Clear, specific answers are a good sign. Vague ones tell you what you need to know.

ASK A CONSULTANCY

- ? What decision or deliverable will we have at the end?
- ? Who on your team will do the work, and who will we hand over to?
- ? How will you leave us able to run what you design?
- ? What is explicitly out of scope?

ASK A MANAGED SERVICE PROVIDER

- ? What are the service levels, and how are they reported?
- ? Who responds out of hours, and how quickly?
- ? How do you report and control our AWS cost each month?
- ? What does exit look like if we part ways?

WORKSHEET

Which one do you need?

Tick the statements that are true today. Mostly in the first group points to consultancy. Mostly in the second points to a managed service. A mix usually means both, in that order.

- [ ] **We do not yet know what the estate should look like**
  Points to consultancy.

- [ ] **A board or leadership decision is waiting on options**
  Points to consultancy.

- [ ] **We need an independent cost or security review**
  Points to consultancy.

- [ ] **We know the target, but lack people to run it**
  Points to a managed service.

- [ ] **Alerts, patching or backups are slipping**
  Points to a managed service.

- [ ] **We need cover outside working hours**
  Points to a managed service.

- [ ] **Cost creeps back after every clean-up**
  Points to a managed service with monthly cost reporting.

TRANSPUTEC

Not sure which you need?

Start with a short conversation. We will help you work out whether you need a decision, someone to run the estate, or both.

Talk to our AWS team

WEEK 2 · FINOPS

Five places your cloud cost hides.

You cannot cut what you cannot see. A practical guide to the usual suspects behind a climbing AWS bill.

INSIDE

Contents

Five places AWS spend hides, what each looks like, where to look in your own account and what to do first.

Introduction 17

01 The five usual suspects 18

02 Run your own cost hunt 24

INTRODUCTION

A climbing bill is rarely one big mistake.

It is usually many small ones, running quietly where nobody is looking. The good news: they tend to hide in the same five places, and each one can be found with tools already in your AWS account.

Visibility comes first

Before anything can be cut, someone has to see it, name it and know who owns it.

Every cost needs an owner

Spend without an owner is spend nobody will question. Ownership turns a number into a decision.

Finding it once is not enough

Waste returns. The habit of looking every month is what keeps the bill honest.

01

PART 01

The five usual suspects.

Each one looks harmless on its own. Together they explain most surprise bills.

01 Idle and oversized compute

02 Storage nobody deletes

03 Data on the move

04 Forgotten environments

05 Commitments that do not fit

01

Idle and oversized compute

Instances sized for a peak that never comes, or left running overnight and at weekends.

WHAT IT LOOKS LIKE

Low utilisation week after week. Development servers running around the clock. Instance types chosen years ago and never revisited.

WHY IT HAPPENS

Teams size for safety, and nobody is asked to size down once the system settles.

WHERE TO LOOK

AWS Compute Optimizer recommendations, and CPU and memory utilisation in CloudWatch.

WHAT TO DO FIRST

Schedule non-production to stop out of hours, then rightsize the clearest cases.

OWNER

Engineering lead for each workload

Bring this to the monthly review, with a date for each action.

02

Storage nobody deletes

Volumes, snapshots and buckets that outlive the work they were created for.

WHAT IT LOOKS LIKE

Unattached EBS volumes. Snapshots from servers long gone. Buckets with everything in the most expensive tier.

WHY IT HAPPENS

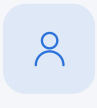

Deleting feels risky, keeping feels free, and nobody owns the clean-up.

WHERE TO LOOK

EBS volumes in the available state, the snapshot list sorted by age, and S3 Storage Lens.

WHAT TO DO FIRST

Agree a retention rule, delete what is clearly orphaned and add lifecycle policies to buckets.

OWNER

Platform or infrastructure team

Bring this to the monthly review, with a date for each action.

03

Data on the move

Traffic between zones, regions and the internet that nobody designed to be costly.

WHAT IT LOOKS LIKE

Data transfer lines growing faster than the services that cause them. NAT gateways processing more than expected.

WHY IT HAPPENS

Architecture choices made for resilience or convenience, without a view of what moving data costs.

WHERE TO LOOK

Cost Explorer grouped by usage type, filtered to data transfer and NAT gateway charges.

WHAT TO DO FIRST

Find the top flows, then review VPC endpoints, placement and caching for the biggest ones.

OWNER

Solution architect

Bring this to the monthly review, with a date for each action.

04

Forgotten environments

Test, demo and proof-of-concept stacks that outlived the project they were built for.

WHAT IT LOOKS LIKE

Resources with no tags, unfamiliar names or a creator who has since left the business.

WHY IT HAPPENS

Spinning up is easy and celebrated. Shutting down is nobody's job.

WHERE TO LOOK

Untagged resources in Tag Editor, and stacks with no named owner or recent activity.

WHAT TO DO FIRST

Tag or turn off. Anything with no owner after a fair notice period gets switched off.

OWNER

Each project or product owner

Bring this to the monthly review, with a date for each action.

05

Commitments that do not fit

Paying on-demand rates for steady workloads, or committing to usage that has since moved.

WHAT IT LOOKS LIKE

Steady, predictable workloads with no commitment at all, or Savings Plans that are no longer fully used.

WHY IT HAPPENS

Commitments are bought once, then the estate changes underneath them.

WHERE TO LOOK

Savings Plans and Reserved Instance coverage and utilisation reports in the Billing console.

WHAT TO DO FIRST

Review coverage and utilisation before buying or renewing anything new.

OWNER

Finance with engineering

Bring this to the monthly review, with a date for each action.

RUN IT YOURSELF

A one-hour cost hunt

Block an hour with one engineer and one person from finance. Work through the five suspects in this order and leave with named owners.

01 **Open Cost Explorer and group by service**

Note the top services and anything that grew since last month.

02 **Check compute utilisation**

List instances with consistently low use, and anything non-production running all week.

03 **List orphaned storage**

Unattached volumes, old snapshots and buckets without lifecycle rules.

04 **Look at data transfer lines**

Find the biggest flows and ask whether they were designed or accidental.

05 **Review untagged resources and commitments**

Find what has no owner, then check commitment coverage and utilisation.

06 **Assign an owner to every finding**

One name per item, with a date to come back to it.

REMEMBER

The goal of the first hour is not savings. It is a list of findings with an owner against each one.

CHECKLIST

The five suspects, ticked off

Use this each month. Anything you cannot tick goes on the list with an owner.

- [ ] **Compute is sized to real use**
  Non-production stops out of hours.

- [ ] **No unattached volumes or stale snapshots**
  Retention rule agreed and applied.

- [ ] **Data transfer is understood**
  Top flows reviewed and explained.

- [ ] **Every resource has an owner**
  Untagged resources tagged or switched off.

- [ ] **Commitments match usage**
  Coverage and utilisation checked before any purchase.

- [ ] **Findings have owners and dates**
  Reviewed again next month.

TRANSPUTEC

Find yours before the next invoice.

Most estates have at least one of these. We can run the hunt with you and leave you with a clear, owned list.

Ask for a cost review

transputec.com

WEEK 3 · AWS · FINOPS

FinOps is not a tool. It is a discipline.

Visibility, accountability, optimisation and continuous review. What each one means, and how to make it a habit.

INSIDE

Contents

What FinOps really means, the four parts that make it work, who does what, and how to start in your first month.

Introduction 29

01 The four parts 31

02 Myths and roles 36

03 Your first month 38

INTRODUCTION

Spending with intent, not just spending less.

FinOps is how engineering, finance and the business work together so that every pound of cloud spend is seen, owned and deliberate. It is less about a product you install and more about how your teams behave.

It starts with seeing

Clear, shared data on what is being spent, where and why.

It works through ownership

Teams who build and run services also own what those services cost.

It lasts through habit

A regular rhythm of review keeps decisions fresh as the estate changes.

FinOps is not a project with an end date. It is a habit your teams keep.

TRANSPUTEC · FINOPS

01

PART 01

Four parts, one cycle.

Each part supports the next. Skip one and the cycle stalls.

01 Visibility

02 Accountability

03 Optimisation

04 Continuous review

01

Visibility

See where every pound goes, in terms the business understands.

WHAT IT MEANS

Cost data that is timely, trusted and broken down by team, product and environment.

WHAT GOOD LOOKS LIKE

Anyone can answer what a service costs and why it changed, without a spreadsheet hunt.

FIRST STEP

Agree a tagging standard and switch on cost allocation tags.

WATCH OUT FOR

Dashboards nobody opens. Visibility only counts if it is used.

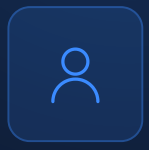

OWNER

Finance and platform team together

Bring this to the monthly review, with a date for each action.

02

Accountability

Every cost has a named owner who can explain it and act on it.

WHAT IT MEANS

The people who build and run a service also own what it costs.

WHAT GOOD LOOKS LIKE

Owners see their own spend, and expect to be asked about it.

FIRST STEP

Map each account, product or tag to one accountable owner.

WATCH OUT FOR

Shared costs with no owner. Split them, or name a single owner.

OWNER

Product and engineering leads

Bring this to the monthly review, with a date for each action.

03

Optimisation

Spend with intent: right size, right pricing model, right time.

WHAT IT MEANS

Rightsizing, scheduling, clearing waste and matching commitments to steady use.

WHAT GOOD LOOKS LIKE

Savings come from regular, small decisions rather than an annual panic.

FIRST STEP

Act on the clearest recommendations in Compute Optimizer and schedule non-production.

WATCH OUT FOR

Cutting what supports revenue. Optimise for value, not just for less.

OWNER

Engineering, with finance input

Bring this to the monthly review, with a date for each action.

04

Continuous review

Check, adjust and repeat, on a rhythm everyone knows.

WHAT IT MEANS

A regular review of spend, anomalies, commitments and actions.

WHAT GOOD LOOKS LIKE

A short monthly meeting with owners, and alerts that catch surprises between them.

FIRST STEP

Set AWS Budgets and Cost Anomaly Detection, then book a monthly review.

WATCH OUT FOR

Reviews that report but never decide. End each one with owned actions.

OWNER

A named FinOps lead

Bring this to the monthly review, with a date for each action.

MYTH VS REALITY

What FinOps is not

Four common misunderstandings that stop FinOps before it starts.

	MYTH	REALITY
Tooling	FinOps is a tool you buy.	It is a discipline your teams practise. Tools help, habits deliver.
Goal	FinOps means cutting cost.	It means spending with intent, which sometimes means spending more.
Ownership	Finance owns it.	Engineering, finance and the business share it.
Timeline	It is a one-off project.	It is a continuous cycle of review and improvement.
Who starts	You need a big team first.	One named lead and a monthly review is enough to begin.

WHO DOES WHAT

Shared work, clear roles

FinOps works when each group knows its part and meets the others regularly.

Engineering

Designs and runs services with cost in mind. Owns rightsizing, scheduling and clean-up.

Finance

Owns budgets, forecasts and commitments. Turns cost data into planning.

Business leaders

Set priorities and decide what is worth spending on.

FinOps lead

Runs the rhythm: data, reviews, actions and follow-up.

> **If you only do one thing, name the FinOps lead. Everything else follows from someone owning the rhythm.**

GETTING STARTED

Your first month of FinOps

A simple sequence that gets the cycle turning without a big programme.

Week one: see it

Turn on cost allocation tags, agree a tagging standard and build one shared view of spend.

Week two: own it

Name an owner for each account or product, and share their spend with them.

Week three: act on it

Take the clearest optimisation actions: schedule non-production, clear orphaned storage.

Week four: review it

Hold the first monthly review. Agree actions, owners and the next date.

> **Next month, repeat. That is the discipline.**

TRANSPUTEC

Not a project.
A habit.

We help teams set up the rhythm, the data and the ownership that make FinOps stick.

Talk to us about FinOps

transputec.com

WEEK 4 · IT PROCUREMENT

The laptop is the cheap part.

Buying the hardware is day one. The years after it, running and securing the fleet, are where the cost lives.

INSIDE

Contents

Why the purchase price is the smallest part of owning a device, and how to plan the whole lifecycle from day one.

Introduction 42

01 The lifecycle 43

02 Buying well 49

INTRODUCTION

The invoice is only day one.

A device fleet is judged at purchase on price. It is paid for over its whole life: every set-up, support call, security update, repair and, finally, a safe and certified retirement.

Price is visible

The purchase cost is on one invoice, so it gets the scrutiny.

Running cost is scattered

Support, repairs and lost hours are spread across teams and budgets, so they rarely get added up.

Risk is the hidden cost

An unpatched, unencrypted or badly retired device can cost more than the fleet itself.

01

PART 01

Plan the whole life.

Every device passes through the same stages. Each one has a cost and an owner.

01 The device lifecycle

02 Deploy, support, secure, retire

03 Buying vs managing

THE LIFECYCLE

Six stages, one fleet

Plan each stage before you buy, and the purchase decision changes.

Buy

Choose devices against real roles and refresh cycles, not just the unit price.

Deploy

Image, enrol, ship and get each person productive from their first day.

Support

Handle tickets, faults and warranty claims without people waiting on a fix.

Secure

Patch, encrypt, protect and know where every device is.

Retire

Wipe data to a certified standard, then recycle or resell responsibly.

> **Ask of every quote: what happens to this device after it arrives?**

01

Deploy

Getting a device from the box into a productive person's hands.

THE WORK

Imaging, enrolment into management tools, shipping and first-day set-up.

HIDDEN COST

Engineer time per device, and the hours a new starter waits to begin.

ASK YOURSELF

Who sets up a new starter's device today, and how long does it take?

GOOD LOOKS LIKE

Devices arrive ready to use, enrolled and secured, wherever the person works.

OWNER

IT service desk

Bring this to the monthly review, with a date for each action.

02

Support and repair

Keeping people working when hardware fails.

THE WORK

Tickets, diagnosis, warranty claims, repairs and swap-out devices.

HIDDEN COST

Lost working hours while people wait, and engineer time chasing warranty.

ASK YOURSELF

What happens when a laptop fails the day before a deadline?

GOOD LOOKS LIKE

A clear repair or replace route, with a spare ready to go.

OWNER

IT support lead

Bring this to the monthly review, with a date for each action.

03

Secure

Every device is a door into your business.

THE WORK

Patching, disk encryption, endpoint protection and a plan for loss or theft.

HIDDEN COST

The impact of a breach that starts on one unmanaged device.

ASK YOURSELF

Could you prove every device is encrypted and up to date today?

GOOD LOOKS LIKE

Central reporting that shows compliance across the whole fleet at a glance.

OWNER

Security owner

Bring this to the monthly review, with a date for each action.

04

Retire

The end of life is where data leaks and value is lost.

THE WORK

Certified data wiping, collection, responsible recycling or resale, and refresh planning.

HIDDEN COST

Devices stored in cupboards, data left on drives, and residual value thrown away.

ASK YOURSELF

Where do your old devices go, and what is still on them?

GOOD LOOKS LIKE

A certificate for every wiped device, and value recovered where possible.

OWNER

IT and compliance

Bring this to the monthly review, with a date for each action.

TWO APPROACHES

Buying devices vs managing a fleet

The same hardware, two very different ways to own it.

	BUYING DEVICES	MANAGING A FLEET
Focus	Unit price at purchase.	Total cost and risk across the device's life.
Set-up	Done in-house, device by device.	Planned, repeatable and ready on arrival.
Support	Handled as tickets come in.	Agreed repair and replacement routes.
Security	Checked when there is time.	Reported centrally and continuously.
End of life	Often an afterthought.	Certified wiping, recycling or resale, planned up front.

BEFORE YOU BUY

Questions to ask any supplier

Use these to compare offers on the whole lifecycle, not just the price per device.

ABOUT THE DEVICES

- ? How will these devices be set up and delivered to our people?
- ? What is the repair and replacement route, and how fast is it?
- ? How long will this model be supported with updates?

ABOUT THE LIFECYCLE

- ? How do you report on security and compliance across the fleet?
- ? What happens to devices at end of life, and do we get certificates?
- ? Can you recover value from devices we retire?

CHECKLIST

Before you sign the order

Tick each one before the purchase goes ahead.

- [ ] **Devices matched to roles**
  Not one model for everyone by default.

- [ ] **Deployment plan agreed**
  Who sets up, how, and how quickly.

- [ ] **Support and repair route defined**
  Including spares and warranty handling.

- [ ] **Security baseline set**
  Encryption, patching and protection from day one.

- [ ] **End-of-life plan agreed**
  Certified wiping and recycling or resale.

- [ ] **Refresh cycle planned**
  So the next purchase is a plan, not a surprise.

TRANSPUTEC

Plan the lifecycle, not just the purchase.

From supply to secure retirement, one partner can manage the whole fleet for you.

Talk to our procurement team

transputec.com

WEEK 5 · FINOPS

Your AWS cost-control checklist.

Five checks to review your own cloud cost. The useful takeaway, given away free.

INSIDE

Contents

Five checks to review your own AWS cost each month, with the tools to use, how to tell it is working and a printable checklist.

How to use it 55

01 The five checks 56

02 The monthly review 62

HOW TO USE IT

Five checks. Every month.

Run this checklist once a month with the people who own the spend. Each check takes minutes in the AWS console. The value comes from doing it every time, not from doing it perfectly once.

Bring the owners

Invite the people who can act: an engineer, someone from finance and each budget owner.

Work in order

The checks build on each other. Ownership first makes everything after it faster.

End with actions

Leave with a short list of actions, an owner for each and next month's date.

01

PART 01

The five checks.

In order, every month, with the people who own the spend.

01	Give every resource an owner
02	Switch off what is idle
03	Clear out old storage
04	Match commitments to usage
05	Set alerts, then review

01

Give every resource an owner

Spend without an owner is spend nobody will question.

DO THIS

Tag by team, project and environment, then switch on cost allocation tags.

USING

AWS Cost Allocation Tags and Tag Editor.

IT IS WORKING WHEN

You can group the whole bill by owner, with little left untagged.

COMMON SNAG

Tags applied by hand drift. Enforce them with policy where you can.

OWNER

Platform team

Bring this to the monthly review, with a date for each action.

02

Switch off what is idle

Pay for what you use, not for what is left running.

DO THIS

Schedule non-production to stop out of hours, and rightsize from real utilisation.

USING

Instance Scheduler and AWS Compute Optimizer.

IT IS WORKING WHEN

Non-production is quiet at night and weekends, and sizes match real use.

COMMON SNAG

Teams fear breaking things. Start with clearly non-critical systems.

OWNER

Engineering leads

Bring this to the monthly review, with a date for each action.

03

Clear out old storage

What nobody deletes, everyone pays for.

DO THIS

Delete unattached volumes and stale snapshots, and add lifecycle rules to buckets.

USING

EBS and snapshot views, S3 lifecycle policies and S3 Storage Lens.

IT IS WORKING WHEN

Storage grows with the business, not with time.

COMMON SNAG

Uncertainty about what is safe to delete. Agree a retention rule first.

OWNER

Infrastructure team

Bring this to the monthly review, with a date for each action.

04

Match commitments to usage

Commit to what is steady. Stay flexible on the rest.

DO THIS

Check coverage and utilisation before you buy or renew anything.

USING

Savings Plans and Reserved Instance coverage and utilisation reports.

IT IS WORKING WHEN

Steady workloads are covered and commitments are fully used.

COMMON SNAG

Buying on last year's estate. Review after big changes.

OWNER

Finance with engineering

Bring this to the monthly review, with a date for each action.

05

Set alerts, then review

Catch surprises between reviews, not on the invoice.

DO THIS

Put budgets and anomaly alerts in place, and review them with each owner.

USING

AWS Budgets and AWS Cost Anomaly Detection.

IT IS WORKING WHEN

Owners hear about spikes within days, and act on them.

COMMON SNAG

Alerts sent to a shared inbox nobody reads. Route them to owners.

OWNER

FinOps lead

Bring this to the monthly review, with a date for each action.

MONTHLY REVIEW

A thirty-minute agenda

Keep it short, keep it regular and always end with owned actions.

01 What changed

Review the month's movement by service and by owner.

02 Anomalies

Walk through any alerts and confirm each was explained or fixed.

03 Last month's actions

Close what is done. Re-date what is not, with a reason.

04 The five checks

Run the checklist and note anything you could not tick.

05 New actions

One owner and one date for each, then book next month.

REMEMBER

Consistency beats depth. A short review every month does more than a deep one every year.

PRINTABLE CHECKLIST

This month's review

Print this page or copy it into your meeting notes. Tick each check, and note the owner for anything left open.

- [ ] **Every resource has an owner**
  Owner for gaps: _____

- [ ] **Idle resources switched off or rightsized**
  Owner for gaps: _____

- [ ] **Old storage cleared**
  Owner for gaps: _____

- [ ] **Commitments match usage**
  Owner for gaps: _____

- [ ] **Budgets and anomaly alerts reviewed**
  Owner for gaps: _____

- [ ] **Actions agreed and next review booked**
  Date: _____

TRANSPUTEC

Five checks. Every month.

Want help running the first one? We can review your AWS cost with you and leave the habit in place.

Ask for a cost review

transputec.com

COMING IN FEBRUARY

Our cost-control webinar brings the whole series together.
