PLAYBOOK NO. 01 · AI AT WORK

The AI-ready organisation.

Where Claude and modern AI tools actually earn their keep, team by team, and how to make the value stick.

INSIDE

Contents

Where Claude and other AI assistants earn their keep, team by team, and how to roll them out so the value is real and lasting.

Foreword 03

Introduction 04

01 What AI assistants are good at 06

02 Use cases by team 10

03 Rolling it out well 15

FOREWORD

Most organisations are not short of AI. They are short of a plan for it.

AI assistants such as Claude, ChatGPT, Gemini and Microsoft Copilot are now good enough to change how everyday work gets done. Drafting, summarising, analysing, coding and answering questions are no longer experiments. They are capabilities your people can use this afternoon.

Yet in many organisations the picture is uneven. A few enthusiasts get remarkable results, most colleagues try a tool once and drift away, and leaders cannot tell whether any of it is making a difference.

This playbook is the practical middle path. It shows where AI assistants create real value, what good use looks like in each team, and how to roll them out in a way that is safe, measurable and sustainable.

The Transputec team
Transputec

INTRODUCTION

The tools are ready. The question is whether you are.

Modern AI assistants can read, write, reason over documents and work with data. The organisations that benefit most are not the ones with the most licences. They are the ones that are clear about where AI helps, who owns it and how it is used.

Start with the work, not the tool

Find the tasks that are frequent, text-heavy and time-consuming. That is where assistants pay back first.

Give it an owner

Someone needs to own adoption, guidance and results, or AI becomes everyone's side project and nobody's priority.

Make safe use the easy use

Approved tools, clear data rules and a simple policy let people move fast without creating risk.

AI does not replace your people. It gives each of them a capable assistant.

The question for leaders is how to make that assistant useful, safe and part of how work actually gets done.

01

PART 01

What it is good at.

A clear-eyed view of where today's assistants are strong, and where they still need a human.

01 Strengths and limits

02 The four jobs AI does well

03 Where to be careful

UNDERSTANDING THE TOOLS

A capable colleague with no memory of yesterday

> **Treat AI output as a strong first draft from a capable colleague, not as a final answer.**

The easiest way to think about an AI assistant is as a very well-read colleague who works quickly, never tires and has no context about your business unless you give it. It can draft a proposal in seconds, but it does not know your pricing. It can summarise a contract, but it does not know which clauses your legal team worries about.

That framing explains most of what goes right and wrong. When people give an assistant clear instructions, relevant documents and a defined outcome, results are often excellent. When they ask a vague question and accept the first answer, results are generic at best and wrong at worst.

Modern assistants such as Claude can work with long documents, follow detailed instructions, write and review code, analyse spreadsheets and reason through multi-step problems. Many can now connect to the tools your people already use, such as email, documents and ticketing systems, which is where the biggest gains tend to come from.

What they cannot do is guarantee they are right. Assistants can produce confident answers that are wrong, especially on facts, figures and recent events. Good use always keeps a person accountable for the output.

THE FOUR JOBS

Four jobs AI assistants do well

Almost every valuable use case is a version of one of these four.

Draft

First versions of emails, proposals, reports, policies and job descriptions, written to your brief.

Digest

Summaries of long documents, meetings, threads and research, with the key points pulled out.

Analyse

Working through data, comparing options, spotting patterns and explaining the reasoning.

Build

Writing and reviewing code, formulas, scripts and automations, with a person checking the result.

> **If a task involves reading or writing a lot of text, it is a strong candidate for AI assistance.**

STRENGTHS AND LIMITS

Where to lean in, where to be careful

A balanced view helps you set expectations before anyone is disappointed.

AREA	LEAN IN	BE CAREFUL
Writing	Drafting, rewriting for tone, shortening, translating.	Final wording for legal, financial or sensitive messages.
Research	Summarising material you provide, comparing sources.	Facts and figures it was not given. Always verify.
Analysis	Structuring problems, exploring data, explaining trends.	Calculations that matter. Check them independently.
Code	Drafting, reviewing, explaining and testing code.	Deploying anything to production without review.
Decisions	Laying out options, risks and trade-offs.	Delegating the decision itself. People stay accountable.

02

PART 02

Use cases, team by team.

Where real organisations are getting value today, in every function.

01 Sales and marketing

02 Operations, finance and HR

03 IT, service and leadership

USE CASES

Sales and marketing

SALES

Account research and proposal drafts

THE TASK

Preparing for calls and writing tailored proposals.

HOW AI HELPS

Summarises public information about a prospect and drafts proposals from your templates.

WHAT GOOD LOOKS LIKE

Reps spend more time with customers and less time formatting.

WATCH OUT

Check every claim about the prospect. Never paste confidential deal terms into unapproved tools.

MARKETING

Content that keeps a consistent voice

THE TASK

Blogs, social posts, emails and campaign variations.

HOW AI HELPS

Drafts from a brief and a style guide, then adapts for each channel.

WHAT GOOD LOOKS LIKE

More output, same quality bar, with editors focused on judgement.

WATCH OUT

Fact-check claims and avoid publishing unedited AI text.

USE CASES

Operations, finance and HR

OPERATIONS

Process documents and standard operating procedures

THE TASK

Writing and updating procedures nobody has time for.

WHAT GOOD LOOKS LIKE

Procedures that are current, consistent and easy to follow.

HOW AI HELPS

Turns rough notes or a recorded walkthrough into a clear, structured procedure.

WATCH OUT

The process owner signs off every procedure.

FINANCE

Variance commentary and report narratives

THE TASK

Explaining what changed and why each month.

WHAT GOOD LOOKS LIKE

Faster month-end narratives that finance reviews, not writes from scratch.

HOW AI HELPS

Drafts commentary from the figures you provide and flags unusual movements.

WATCH OUT

Numbers come from your systems, never from the model.

HR

Job descriptions, policies and onboarding

THE TASK

Drafting role profiles, policy updates and new starter guides.

WHAT GOOD LOOKS LIKE

Quicker hiring cycles and clearer policies.

HOW AI HELPS

Produces consistent first drafts in your tone and structure.

WATCH OUT

Keep personal data out of unapproved tools. Check for biased language.

USE CASES

IT, service and leadership

IT

Scripts, troubleshooting and documentation

THE TASK

Writing scripts, diagnosing issues and documenting systems.

WHAT GOOD LOOKS LIKE

Engineers ship faster with better documentation.

HOW AI HELPS

Drafts and explains code, suggests fixes and writes runbooks.

WATCH OUT

Review and test before anything touches production.

SERVICE DESK

Faster, more consistent answers

THE TASK

Answering repeat questions and triaging tickets.

WHAT GOOD LOOKS LIKE

Quicker resolution and a knowledge base that keeps improving.

HOW AI HELPS

Suggests responses from your knowledge base and summarises long tickets.

WATCH OUT

Agents check suggestions before sending.

LEADERSHIP

Briefings and decision support

THE TASK

Digesting board packs, reports and market news.

WHAT GOOD LOOKS LIKE

Better prepared meetings and clearer decisions.

HOW AI HELPS

Summarises papers and lays out options and risks.

WATCH OUT

The decision and accountability stay with leaders.

PRIORITISE

Where to start

Plot candidate use cases by value and ease. Start top right, plan top left, and park the rest.

↑ VALUE

PLAN

High value, harder

Worth doing, but needs data, integration or process change first.

START HERE

High value, easy

Frequent, text-heavy tasks with clear owners. Your quick wins.

AVOID

Low value, hard

Interesting projects that will not move the needle.

LET PEOPLE EXPLORE

Low value, easy

Personal productivity. Allow it within the policy, but do not invest heavily.

EASE TO ADOPT →

03

PART 03

Roll it out well.

Licences are the easy part. Adoption is where value is won or lost.

01 Five principles

02 The rollout sequence

03 Measuring what matters

PRINCIPLES

Five principles for adoption that lasts

Organisations that get lasting value from AI tend to follow the same rules.

01 **Pick approved tools, then make them easy to get**

Choose business-grade tools with the right data protections, and remove friction to access them.

02 **Teach the craft, not just the buttons**

Show people how to brief an assistant, check its work and use it in their own role.

03 **Start with champions**

Find enthusiasts in every team, give them time, and let them share what works.

04 **Keep a person accountable**

Every AI-assisted output has a human owner who checks it before it matters.

05 **Measure and share results**

Track time saved and quality, tell the stories, and expand what works.

THE SEQUENCE

From pilot to everyday use

A simple rollout sequence that builds evidence before scale.

Choose

Select tools and agree a short acceptable use policy.

Pilot

Run a focused pilot with champions on a handful of high-value use cases.

Prove

Measure results, collect examples and refine the guidance.

Scale

Expand team by team, with training and a named owner in each.

Embed

Build AI into processes and review usage and value every quarter.

> **Each step earns the right to the next. Skip proof, and scale stalls.**

MEASURING VALUE

What to measure

Simple measures, tracked consistently, beat a complex scorecard nobody updates.

MEASURE	WHAT IT TELLS YOU	HOW TO CAPTURE IT
Active use	Whether people are actually using the tools.	Usage reports from the platform.
Time saved	Where capacity is being released.	Short before-and-after estimates from users.
Quality	Whether outputs are good enough to use.	Reviewer sign-off and spot checks.
Stories	What changed for real people.	A monthly round-up from champions.
Risk events	Whether guardrails are working.	Policy breaches and near misses logged.

COMMON PITFALLS

Five ways AI rollouts stall

Each is avoidable with a little planning.

01 **Licences without training**

People try once, get a generic answer, and give up.

02 **No approved route**

Staff use personal accounts, and data goes where it should not.

03 **Pilots that never end**

Without success criteria, pilots drift and nothing scales.

04 **Nobody owns it**

Adoption becomes everyone's side project.

05 **Measuring nothing**

Without evidence, budgets get cut at the first review.

REMEMBER

The fix for most of these is the same: a named owner, a short policy and a regular review.

BEFORE YOU START

Questions for your leadership team

Work through these together before you buy or expand anything.

STRATEGY

- ? Which three tasks would we most like to take off our people's plates?
- ? Who will own AI adoption, and how will we know it is working?
- ? What does good look like in six months?

SAFETY

- ? Which tools are approved, and what data can go into them?
- ? How will we train people to check AI output?
- ? How will we handle mistakes when they happen?

CHECKLIST

Are you AI-ready?

Tick what is in place today. Anything left blank is your next step.

- [ ] **Approved AI tools are available to staff**
  With business-grade data protections.

- [ ] **A short acceptable use policy is published**
  Plain language, one or two pages.

- [ ] **A named owner for AI adoption**
  With time and budget to do the job.

- [ ] **Champions in each team**
  Sharing prompts, examples and results.

- [ ] **Training on briefing and checking AI work**
  Not just how to log in.

- [ ] **Priority use cases chosen**
  With success measures agreed.

- [ ] **A regular review of value and risk**
  Quarterly is enough to start.

GLOSSARY

Words worth knowing

AI assistant

A tool such as Claude, ChatGPT, Gemini or Copilot that responds to instructions in plain language.

Large language model

The type of AI model behind most assistants, trained on large amounts of text.

Prompt

The instructions and context you give an assistant.

Context

The documents, data and background an assistant can see when it answers.

Hallucination

A confident answer that is wrong or made up.

Connector

An integration that lets an assistant read or act in another tool, such as email or documents.

Agent

An AI system that can take a series of actions towards a goal, not just answer.

Acceptable use policy

The rules for how staff may use AI tools and data.

Champion

A colleague who helps their team adopt AI well.

Human in the loop

A person reviews AI output before it is used or acted on.
