TRANSPUTEC

COST CONTROL SERIES

Five places your cloud cost hides

You cannot cut what you cannot see. The usual suspects behind a climbing AWS bill.

START HERE

A climbing bill is rarely one big mistake.

It is usually many small ones, running quietly where nobody is looking.

01

Idle and oversized compute

WHAT IT LOOKS LIKE

Instances sized for a peak that never comes, or left running overnight and at weekends.

WHERE TO LOOK

AWS Compute Optimizer and utilisation in CloudWatch.

02

Storage nobody deletes

WHAT IT LOOKS LIKE

Unattached volumes, old snapshots and buckets with no lifecycle rules.

WHERE TO LOOK

EBS volumes in the available state, and S3 Storage Lens.

03

Data on the move

WHAT IT LOOKS LIKE

Traffic between zones and regions, and NAT gateways processing more than anyone expected.

WHERE TO LOOK

Cost Explorer, grouped by usage type.

04

Forgotten environments

WHAT IT LOOKS LIKE

Test and proof-of-concept stacks that outlived the project they were built for.

WHERE TO LOOK

Untagged resources, and stacks with no named owner.

05

Commitments that do not fit

WHAT IT LOOKS LIKE

On-demand rates for steady workloads, or Savings Plans bought for usage that has since moved.

WHERE TO LOOK

Savings Plans coverage and utilisation reports.

Find yours before the next invoice.

Most estates have at least one of these. The fix starts with seeing it.
